

CARDIAC OPTIMIZATION THROUGH LOW-FREQUENCY ANALYSIS  
OF HEMODYNAMIC VARIABLES

ABSTRACT OF THE DISCLOSURE

A parameter in an implantable cardiac therapy device (ICTD) is optimized based on analysis of a hemodynamic signal. The method includes receiving a hemodynamic signal; filtering the hemodynamic signal data to isolate low frequency data present therein; and sampling the low frequency data according to a sampling algorithm. The parameter is optimized in the ICTD based on an analysis of the sampled low frequency data.
